Document: Author manuscript (under review)

Abstract

Vector databases have proliferated alongside embedding-based applications.
This review compares graph-, tree-, and quantization-based indexes on recall, build cost, and memory, and identifies workloads where each family dominates.

Keywords: vector database, ANN, indexing, review

1. Introduction

This manuscript is part of a realistic but synthetic Open Journal Systems instance used for non-production testing. The content is fictional; any resemblance to real studies is coincidental.

2. Methods

The study design, materials, and analysis described here are illustrative placeholders that mirror the structure of a genuine research article so that downstream tooling sees plausible inputs.
