Document: Author manuscript (as submitted)

Abstract
Code review quality depends on reviewer attention, which is hard to measure directly. Using eye-tracking on 28 developers, we relate fixation patterns to defect-detection rates and discuss interface implications for review tools.

Keywords: code review, human factors, eye tracking, software engineering

1. Introduction
This manuscript is part of a realistic but synthetic Open Journal Systems instance used for non-production testing. The content is fictional; any resemblance to real studies is coincidental.

2. Methods
The study design, materials, and analysis described here are illustrative placeholders that mirror the structure of a genuine research article so that downstream tooling sees plausible inputs.
