Document: Typeset galley (published version)

Abstract

Choosing secondary indexes is a classic trade-off between read acceleration and write amplification.

We benchmark eight index configurations across OLTP and HTAP-style workloads and report when composite indexes stop paying off.

Keywords: databases, indexing, benchmarking, OLTP

1. Introduction

This manuscript is part of a realistic but synthetic Open Journal Systems instance used for non-production testing. The content is fictional; any resemblance to real studies is coincidental.

2. Methods

The study design, materials, and analysis described here are illustrative placeholders that mirror the structure of a genuine research article so that downstream tooling sees plausible inputs.
