Document: Typeset galley (published version)

Abstract

Anomaly detectors often output uncalibrated scores that are hard to threshold operationally. We combine isotonic calibration with conformal prediction and show reliable coverage on five tabular datasets without retraining the base model.

Keywords: anomaly detection, calibration, conformal prediction, tabular data

1. Introduction

This manuscript is part of a realistic but synthetic Open Journal Systems instance used for non-production testing. The content is fictional; any resemblance to real studies is coincidental.

2. Methods

The study design, materials, and analysis described here are illustrative placeholders that mirror the structure of a genuine research article so that downstream tooling sees plausible inputs.
