Abstract

In this editorial we argue that the next gains in applied machine learning will come less from novel models and more from boringly reliable systems engineering around them.

Keywords: editorial, machine learning, reliability

1. Introduction

This manuscript is part of a realistic but synthetic Open Journal Systems instance used for non-production testing. The content is fictional; any resemblance to real studies is coincidental.

2. Methods

The study design, materials, and analysis described here are illustrative placeholders that mirror the structure of a genuine research article so that downstream tooling sees plausible inputs.
