Document: Author manuscript (under review)

Abstract

Product telemetry dashboards expose aggregates that can leak information about individual users.

We study differentially private aggregation under realistic refresh rates and quantify the utility cost of common privacy budgets.

Keywords: differential privacy, telemetry, analytics

1. Introduction

This manuscript is part of a realistic but synthetic Open Journal Systems instance used for non-production testing. The content is fictional; any resemblance to real studies is coincidental.

2. Methods

The study design, materials, and analysis described here are illustrative placeholders that mirror the structure of a genuine research article so that downstream tooling sees plausible inputs.
